

Important Button Battery Safety Alert

Following routine compliance checks and further to increasing global concern of button battery safety we have identified a small number of our products containing button or coin cell batteries. Such batteries can present **a risk of Choking or Ingestion** should the battery compartment be inadvertently accessed or batteries left accessible to vulnerable persons such as children.

DAC1 / DTI series tyre inflators

DTPG7 Digital tyre gauge

DTDG1D04 tread depth gauge

These products are aimed at professional users; however, it is possible that they may also be used by consumers from time to time. As such it is imperative that adequate warnings are provided to ensure such products are kept away from children.

ALWAYS KEEP NEW AND USED BATTERIES OUT OF REACH OF CHILDREN

SEEK IMMEDIATE MEDICAL ATTENTION IF A BATTERY IS SUSPECTED TO BE SWALLOWED OR INSERTED INSIDE ANY PART OF THE BODY

PAS 7055:2025 provides further guidance on this matter, it is the duty of manufactures and producers as well as retailers and distributors to ensure adequate labelling, instructions and packaging, merchandising warnings, and alignment of product safety messaging to ensure such products are kept out of reach of children, not ingested and to seek immediate medical attention if a battery is suspected to be swallowed or inside the body.

We have updated our web site, product labelling, operating instructions, and user manuals. It is essential that these amended instructions are made available to end users, and we ask that you inform your customers accordingly and provide those further down the supply chain with this safety alert.

Your PCL account manager is available to facilitate this and answer any questions you may have regarding the products, safety information and labelling. Product quality and safety are our principal priorities, and we appreciate your support in assisting with this issue.
